Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The target structure especially comprises alpha6beta4 integrin. This is a tumour-associated antignon. The antibody, and its fragments, are useful for treating human mati-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, for in vivo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and monitoring premalignant conditions. Quantitative in vivo diagnosis is carried out by determining the localization of antibody to
                                                                                                                      Novel antibody for diagnosis, treatment of human metastatic and malignant diseases, has binding structure for target structure displayed on cell surface of human gastrointestinal epithelial tumor and normal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to human antibodies, or their antigenbinding fragments, that selectively bind to a human interleukin-21 receptor (IL-21R). The antibodies of the invention are referred to as WUF, WUF-germline, WUI1, 1864, 1895, 19F5, CP5G2 and R18. The antibodies selectively bind the extracellular domain of human IL-21R, or inhibit the binding of II-21 to an IL-21R. Pharmaceutical compositions comprising an antibody or fragment of the invention are useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis, inflammatory bowel disease, crohn's disease, transplant rejection or psoriasis) or hyperproliferative disorders. The present sequence is an anti-IL-21R antibody light chain complementarity determining region of
                              New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```

The human monoclonal antibody D7C2, of isotype IgM, recognises a 30-32 kD polypeptide on the membrane of rhesus positive red blood cells. The antibody agglutinates rhesus positive cells but not rhesus negative cells and is useful diagnostically and also for preventing haemolysis in newborn rhesus positive babies. Recombinant IgM-D7C2 can be produced by born rhesus positive been transformed by a baculovizal vector comprising a D7C2 expression cassette. The present sequence is that of the variable region of the IgM-D7C2 light chain

                     The present invention relates to human antibodies, or their antigen-
binding fragments, that selectively bind to a human interleukin-21
receptor (IL-2IR). The antibodies of the invention are referred to as
WUF, WUF-germline, WU11, 1864, 1875, 1975, CP5G2 and R18. The antibodies
selectively bind the extracellular domain of human IL-2IR, or inhibit the
binding of IL-21 to an IL-2IR. Pharmaceutical compositions comprising an
antibody or fragment of the invention are useful for diagnosing,
preventing or treating autoimmune disorders (e.g. rheumatoid arthritis,
inflammatory bowel disease, Crohn's disease, transplant rejection or
psoriaais) or hyperproliferative disorders. The present sequence is an
anti-IL-2IR antibody light chain complementarity determining region of

```
The present invention relates to human antibodies, or their antigen-
binding fragments, that selectively bind to a human interleukin-21
receptor (IL-21R). The antibodies of the invention are referred to as
MUF, MUF-Germline, MUI1, 18G4, 18A5, 19F5, CPSG2 and R18. The antibodies
selectively bind the extracellular domain of human IL-21R, or inhibit the
binding of IL-21 to an IL-21R. Pharmaceutical compositions comprising an
antibody or fragment of the invention are useful for diagnosing,
preventing or treating autoimmune disorders (e.g. rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                          Whitters MJ, Valge-Archer V, Collins M, Williams AJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 48; 143pp; English.

binding fragments, that selectively bind to a human interleukin-21
receptor (IL-21R). The antibodies of the invention are referred to as
MUF, MUF-Germline, MUI1, 18G4, 18A5, 19F5, CP5G2 and R18. The antibodies
selectively bind the extracellular domain of human IL-21R, or inhibit the
antibody or fragment of the invention are useful for diagnoshing,
preventing or treating autoimmune disorders (e.g. rheumatoid arthritis,
fill ammancory bowel disease, Crohn's disease, transplant rejection or
psoriasis) or hyperproliferative disorders. The present sequence is an
anti-IL-21R antibody light chain variable domain (VL) of the invention.
inflammatory bowel disease, Crohn's disease, transplant rejection or psoriasis) or hyperproliferative disorders. The present sequence is an anti-IL-21R antibody light chain variable domain (VL) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.
                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The human monoclonal antibody D7C2, of isotype IgM, recognises a 30-32 kD polypeptide on the membrane of rheeus positive red blood cells. The antibody agglutinates rhesus positive cells but not rhesus negative cells and is useful diagnostically and also for preventing haemolysis in newborn rhesus positive babies. Recombinant IgM-D7C2 can be produced by comprising a D7C2 expression cassette. The present sequence is that of a recombinant IgM-D7C2 lambda light chain fused downstream of a signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant anti-rhesus D monoclonal antibody - expressed by baculovirus-transformed insect cells and useful for preventing haemolysis in new-born babies.
                                                                                                                                                                                                                                                                                                                                                                                                          /note= "human_lambda light chain constant region and the variable region from anti-rhesus D antibody D7C2"
                                                                                                                                                                                                                                    Human monoclonal antibody; immunoglobulin isotype IgM; agglutination; rhesus positive; rhesus negative; haemolysis; lambda light chain; variable region; insect host cell; baculovirus; recombinant production.

regeneration IV (Reg IV) protein. The invention specifically comprises the amino acid and coding sequences of single chain antibody fragments (scPv's) that bind Reg IV protein. The antibody of the invention is useful for treating, preventing and ameliorating: inflammatory bowel disorders (e.g. ulcerating colitis or Crobn's disease), diabetes (e.g. non-insulin dependent diabetes or insulin dependent diabetes), and cancer of the gastrointestinal tract. The antibody of the invention is also
                                                                                                                                                       antibody; regeneration IV; Reg IV; single chain antibody fragment; scFv; inflammatory bowel disorder; ulcerative colitis; Crohn's disease; diabetes; non-insulin dependent diabetes; insulin dependent diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel antibody, useful for treating, preventing or ameliorating inflammatory bowel disorder, cancer of the gastrointestinal tract or diabetes (non-insulin dependent diabetes or insulin dependent diabetes).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful for detecting the expression of a Reg IV protein. The present amino acid sequence represents an scFv of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The antibodies of the invention are referred to as mult. MUTS. The antibodies of the invention are referred to as selectively bind the extracellular domain of human IL-21R, or inhibit the binding of IL-21 to an IL-21R. Pharmaceutical compositions comprising an antibody or fragment of the invention are useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis, inflammatory bowel disease, Crohn's disease, transplant rejection or psoriasis) or hyperproliferative disorders. The present sequence is an anti-IL-2IR antibody scfv domain of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This polypeptide sequence comprises the VL domain of human scrv antibody 10A6, which is specific for transforming growth factor (TGF) beta-1. It is encoded by a gene (AAT60384) isolated from a peripheral blood lymphocyte library. The antigen-binding domains of human antibodies (see AAM15522-40) to TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in adverse effects of TGF beta, such as (i) promotion of fibrosis (in proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrhosis, post myocardial infarction, post-angioplasty crestenosis, sclaroderma, vascular disorders, cataract, glaucoma, or esp. neural scarring and glomerulonephritis, also (not claimed) osteoporosis), or (ii) immune and inflammatory diseases (e.g. rheumatoid arthritis, macrophage deficiency diseases or macrophage pathogen infection). Nucleic acids encoding human antibody VH and VL can be used for prodn. of recombinant antigen-binding domains. These are highly specific, have low dissociation constants (pref. less than 5 mM) and low IC50s for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Agent contg. antigen-binding domain of human antibody to transforming growth factor beta 1 or 2 - and nucleic acid encoding it, used to neutralise effects of TGF, e.g. for control of fibrosis, immune and

RESULT 11
                           AAW15538
                                                                              The present invention relates to human antibodies, or their antigen-
binding fragments, that selectively bind to a human interleukin-21
receptor (IL-21R). The antibodies of the invention are referred to as
MUF, MUF-germline, MUI1, 1864, 1845, 19F5, CP562 and R18. The antibodies
selectively bind the extracellular domain of human IL-21R, or inhibit the
binding of IL-21 to an IL-21R. Pharmaceutical compositions comprising an
antibody or fragment of the invention are useful for diagnosing,
preventing or treating autoimmune disorders (e.g. rheumacoid arthritis,
inflammatory bowel disease, Crohn's disease, transplant rejection or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ruben SM,
This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BlyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAnDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome light and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrys) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods correct expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders only asthemia gravis and prognosis of singlement disorders including myasthemia gravis and multiple sclerosis, infectious diseases such as ALDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various continintial ammatory, antisathmatic, antisathmatic, neuroprofective, antisathmatory, antisathmatic, antisathmatic, neuroprofective, antisathmatory antisathmatic, antisathmatory antisathmatic, antisathmatory antisathmatic, antisathmatory invention of sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of inventions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the rumour necrosis factor (TNF) super family and induces B cell trumour necrosis factor (TNF) super family and induces B cell cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant syptemsion of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (ADS)). ABP43290-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia. 

Example 1; SEQ ID NO 2084; 394pp; English.

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 1343 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrve) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The from the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including and proliferative disorders including and invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences. lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiarthritic, neuroprotective, antinflammatory, antiasthmatic, antiallergic and cytostatic. This polypeptide sequence is a single chain antibody that binds BLyS of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

Sequence 35, Application US/09315574

Patent No. 6512097

GENERAL INFORMATION:

APPLICANT: Marks, James D.

APPLICANT: Schier, Robert

TITLE OF INVENTION: No. 6512097el High Affinity Human Antibodies to
TITLE OF INVENTION: Tumor Antigens

NUMBER OF SEQUENCES: 141

CORRESPONDENCE ADDRESS:

ADDRESSEE: Majestic, Parsons, Siebert & Hsue P.C.

STREET: Pour Embarcadero Center, Suite 1100

CITY: San Francisco

STATE: California

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

C. I. FUNCTION: Post-transcriptional regulator of nitrogen permeases. It
could be involved in the putative NPRI-dependent phosphorylation
of nitrogen permeases or in the processing and targeting of the
nitrogen permeases at the level of the endoplasmic reticulum.

-I- FUNCTION: Involved in the biosynthesis of L2/HNK-1 carbohydrate epitope on both glycolipids and glycoproteins. Shows strict specificity for Gal betal-3Gal betal-4Xyl, exhibiting negligible incorporation into other galactoside substrates.
-I- CATALYITC ACTIVITY: UDP-glucuronate + 3-beta-D-galactosyl-4-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=22426069; PubMed=12537572;

Buchnera aphidicola (Aphid endosymbiont) contains genes encoding enzymes of histidine biosynthesis.";

Curr. Microbiol. 37:356-358(1998).

-I- FUNCTION: Is required not only for elongation of protein synthesis but also for the initiation of all mRNA translation through initiator ENNA(FMET) aminoacylation (By similarity).

-I- CATALYTIC ACTIVITY: ATP + L-methionine + tRNA(FMET) = AMP + diphosphate + L-methionyl-tRNA(Met).
                                                                                                                                                                                                                                                                                                              Caillaud C., Lyonnet S., Rey F., Melle D., Frebourg T., Berthelon M., Vilarinho L., Vaz Osorio R., Rey J., Munnich A.;

Biol. Chem. 245:2171-2176 (1970).
-!- MISCELLANEOUS: This is a Bence-Jones protein.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.

-!- FUNCTION: Binds to the 40S ribosome and promotes the binding of methionyl-trnAi and mRNA.
-!- FUNCTION: INVOLVED IN TRANSPORT OF PROTEINS TO THE NUCLEUS;
PROBABLY VIA ITS SERINE-RICH ACIDIC N-TERMINAL.
-!- SUBUNIT: eIF-3 is composed of up to 8 different subunits.
-!- SUBCELLULAR LOCATION: Cytoplasmic; mainly.
-!- SIMILARITY: Contains 1 PCI domain.
-!- SIMILARITY: BELONGS TO THE EIF3S8 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

The first sequenced normal hemoglobin lacking histidine in position
146 of the beta-chains. The primary structures of the major and minor hemoglobin components of the great crested newt (Triturus cristatus, Urodela, Amphibla)...
1901. Chem. Hoppe-Seyler 369:1343-1360(1988).
1-1- FUNCTION: Involved in oxygen transport from the lung to the various peripheral tissues.
